

Assignment 2 Spec

Intro

The university's Office of Student Engagement needs a small website that helps students discover campus activities. Create a responsive Campus Event Guide with a home page and a featured event details page. You may invent the university name, organizations, events, locations, and schedule details.

Deliverables

- Two HTML pages: index.html and event.html
- One external stylesheet: css/styles.css
- An images folder containing all local images
- A README.md explaining design decisions and sources
- A GitHub repository with at least five meaningful commits

Project Structure

Page 1: Home Page (index.html)

Site header and navigation

- Website name or logo and a short tagline
- Primary navigation linking to Home, Upcoming Events section, About section, and the Featured Event page
- Semantic structure using header, nav, ul, li, and a elements

Hero section

- A meaningful heading and short introductory paragraph
- A link styled as a button that moves to the upcoming events section
- A decorative or informative image with appropriate alternative text

Upcoming events grid

- At least 5 event cards
- Each card includes an image, event name, date/time, location, category, short description, and meaningful View Details link
- Cards use CSS Grid with at least two different widths

About section

- A heading and one or two explanatory paragraphs
- A list of at least three benefits or services

Footer

- Copyright statement
- Contact email or placeholder
- At least two useful navigation links

Page 2: Event Details (event.html)

Shared header and navigation

- Use the same general header and navigation structure as the home page
- Navigation between index.html and event.html must work correctly

Event introduction

- Event name, large image, category, date/time, location, and an introductory description

Main content and sidebar

- Create a two-column desktop layout using CSS Grid
- Main column: description, attendee expectations, schedule or agenda, at least one list, and accessibility or participation information
- Sidebar: date, time, location, organizer, admission information, and a registration link styled as a button
- On narrow screens, move the sidebar below the main content

Related events

- Include at least three compact event cards

- Use Flexbox and allow the cards to wrap when horizontal space is limited

Footer

- Use the same general footer treatment as the home page

Technical Requirements

A. Semantic HTML

- Use meaningful elements, including header, nav, main, section, article, aside, footer, figure, figcaption, and time where appropriate.
- Use exactly one main element on each page.
- Give every informative image meaningful alt text.

B. CSS Box Model

- Apply margin, padding, border, width or max-width, and box-sizing appropriately.
- Do not create spacing with repeated `<br>` elements or empty paragraphs.

C. Flexbox

- Use Flexbox in at least two meaningful locations, such as navigation, hero content, related events, or footer content.
- At least one Flexbox container must demonstrate alignment, spacing, and/or wrapping using properties such as justify-content, align-items, gap, and flex-wrap.
- Using display: flex by itself is not sufficient evidence of Flexbox understanding.

D. CSS Grid

- Use Grid for the upcoming event cards on index.html, and the main content/sidebar layout on event.html.

E. Responsive Design

- Include the viewport meta element on both pages.
- Include at least two media queries.
- JavaScript is not required. On narrow screens, navigation may wrap or become vertical.

F. CSS Organization and Design

- Use one external stylesheet. Do not use inline CSS or style elements.

Restrictions

- Do not use Bootstrap, Tailwind CSS, CSS component libraries, JavaScript, website builders, or prebuilt templates.
- Do not use generated layout code that you cannot explain.
- You may use your own or appropriately licensed images. Credit sources in README.md when required.

README Requirements

- Project Description: Explain the site's purpose and intended audience.
- Layout Decisions: Identify where you used Flexbox and Grid and explain why each was appropriate.
- Responsive Design: List your breakpoints, describe what changes at each, and state how you tested the pages.
- Semantic HTML: Identify at least four semantic elements and explain why each was appropriate.
- Sources: Credit images, fonts, and borrowed content.
